

# Using “form to letter” functionality to improve clinical care and capture quality metrics for continuous improvement

Ilana Halperin MD MSc FRCPC

Sunnybrook Health Sciences Centre

# Presenter Disclosure

- Faculty / Speaker's Name: Ilana Halperin MD - Assistant Professor, Clinician in Quality and Innovation, Department of Medicine, University of Toronto, OntarioMD Peer Leader, QHR Peer Leader
- Relationships with commercial interests:
  - Speakers Bureau/Honoraria: QHR Technologies Inc.

# Disclosure of Commercial Support

- This program has not received any financial or in-kind support from commercial entities
- Potential for conflict(s) of interest:
  - None

# Mitigating Potential Bias

- Accuro<sup>®</sup> EMR user - Working to build my knowledge of similar functionality in other EMRs to build on the work I am doing with QHR

# Objectives

- Review the role of the EMR in enabling point of care data collection
- Discuss the challenges of using EMR data for quality improvement
- Discuss the potential impact on future design for EMRs

# EMR: Meaningful Use

**Meaningful use** is using certified electronic health record (EHR) technology to:

- Improve **quality**, safety, **efficiency**, and reduce health disparities.
- Engage patients and family.
- Improve care coordination, and **population** and public health.
- Maintain privacy and security of patient health information.

# Sources of Data in the EMR

- Entered by clinician
- Flows into EMR

# Clinician Entered Data

- **Real time**
- Free text, unstructured, **non-standardized**
- **Rapid data entry**
  - Templates, stamps, forms
- **Not good for large scale queries analytics or reporting**

# Data Flows into EMR

- Consults notes
- Labs
  - Inconsistent naming of labs tests
  - Requirement for linking
- Hospital reports (diagnostic imaging, discharge summaries)
- Scanned documents

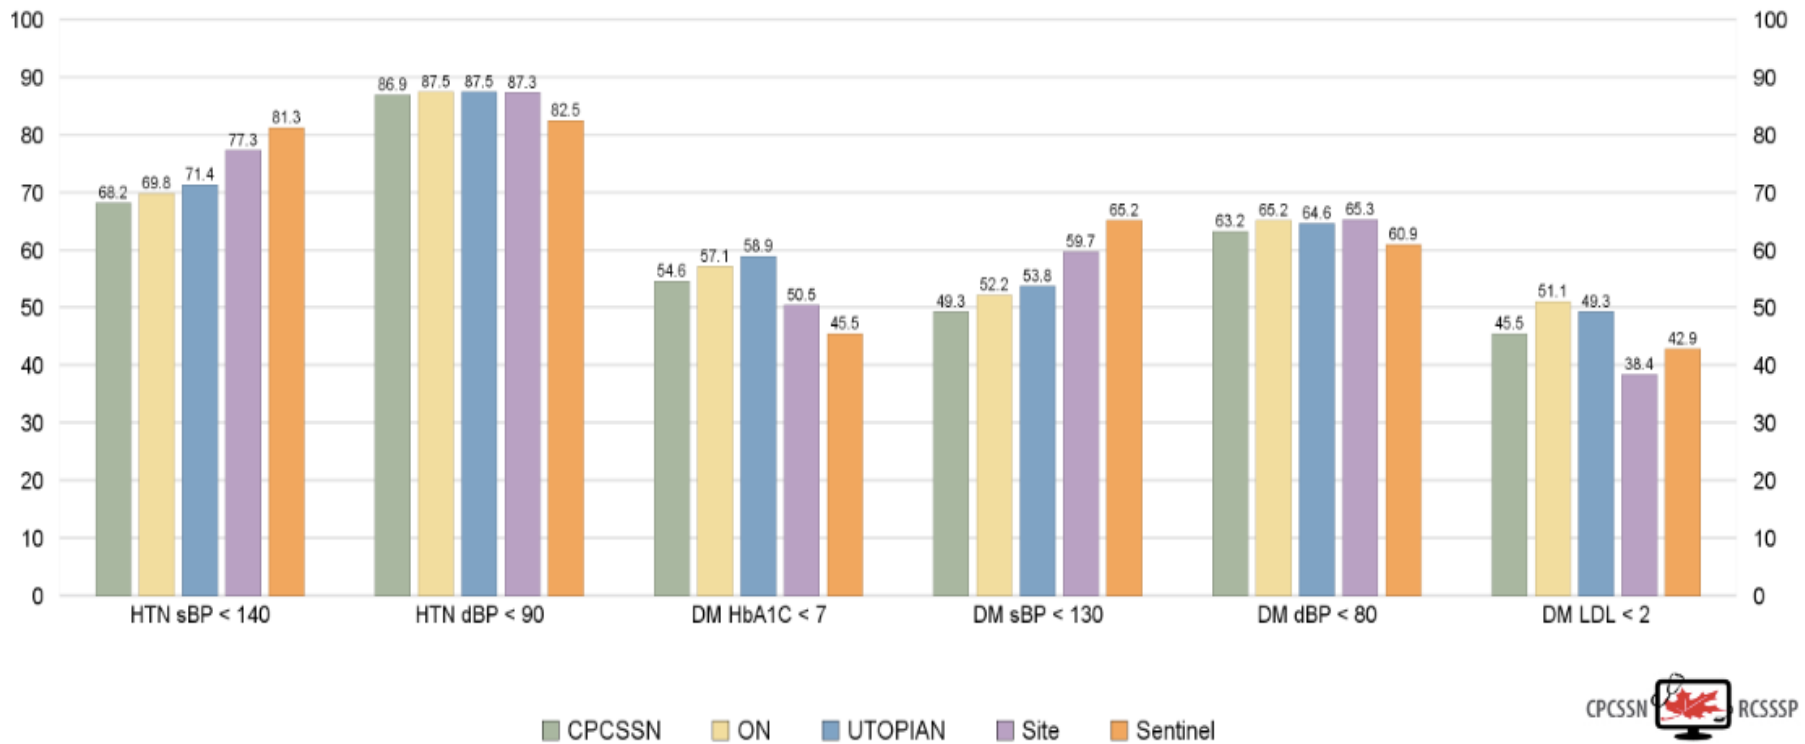

# Aggregated Data Can Flow Out of EMR

- Extracted, cleaned, **standardized**
- Not real time
- **Requires extra resources**
- Can then provide feedback on provider and system level performance for **quality indicators.**

# CPCSSN FEEDBACK REPORT: SENTINEL 00168

Data Up To: June 30, 2015

Indicators of Patients (%) \*

# Key Point-

## Turning Data into Information

***The biggest value of the EMR is not in  
the data you enter  
But  
the information you can retrieve from  
that data to help improve patient care***

Jessica Widdifield, PhD

# Tension Between Quality and Efficiency

- Quality indicators require standardized data to analyze
- Standardized data entry
  - clunky
  - time consuming
  - decrease efficiency
- Standardized tools vary across vendor

# What if more granular data could be used for QI within the EMR without compromising efficiency???

Point of care standardized data entry from patients and providers

Output a completed clinical note or consult letter

Data continually added to a warehouse on the EMR server where reports can be run in real time

# A Case

- 28 F referred for new diagnosis of Type 2 DM discovered in the context of an infertility work up
- PMHx: PCOS, HTN and obesity
- Meds: Janumet and Ramipril

# QHR Accuro<sup>®</sup>

## Form to Letter Solution

Current Medications are:

Smoking and alcohol history is:

Her recent history with me is attached with notes from her Electronic Record.

I hope this information has been of assistance to you.

The video player interface includes a progress bar at the bottom of the video frame, showing a duration of 00:00 to -03:08. The Mac OS X dock is visible at the bottom of the screen, containing icons for various applications like Safari, Mail, and Google Chrome. The system status bar at the top right shows the date and time as "Sun 10:29 PM".

# EA or FTL tools

## PROS

- Efficient clinical notes
- Standardized data entry
- Decision support built in
- Customizable
- All tick boxes traceable for data aggregation

## CONS

- Take time (and money) to build
- Decision support can become outdated
- Customizable

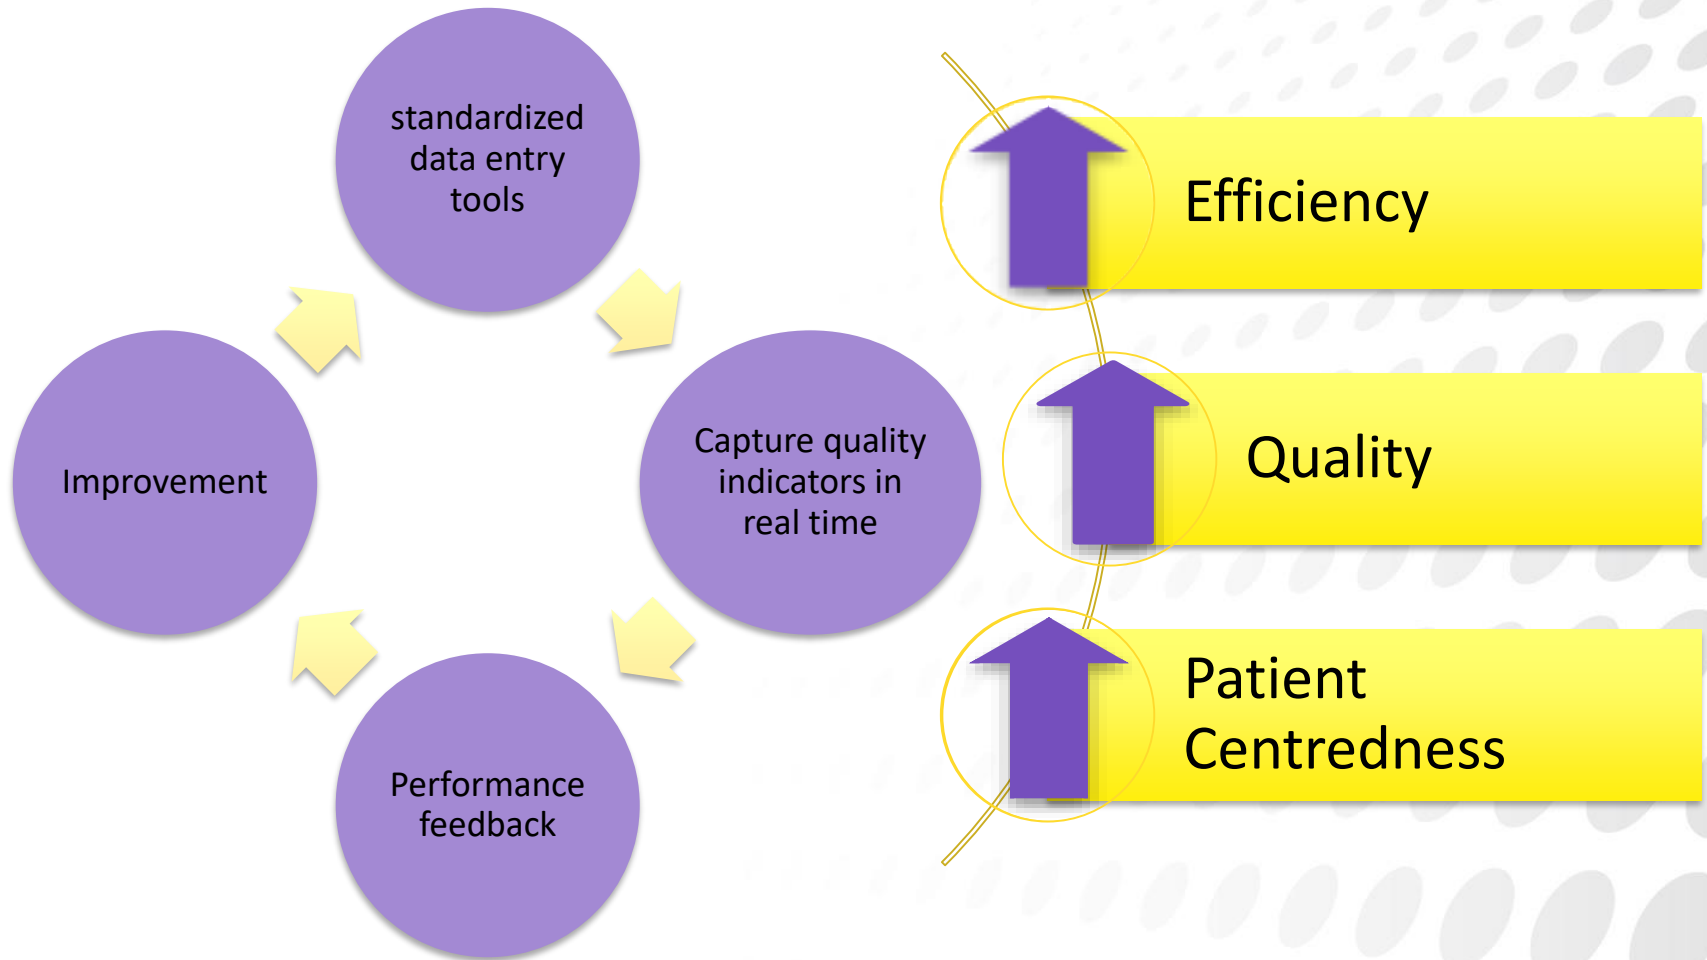

# U of T Endocrinology - Diabetes Balanced Scorecard

- 5 ambulatory diabetes programs
- Inter-professional modified Delphi panel
- 35 performance indicators across 6 domains of quality (safe, effective, efficient, timely, equitable, patient-centred)
- Designed FTL tool to capture the clinician entered data needed for indicators

# New Data Solutions

- Query function with Accuro not robust enough
- Working with the QHR data development team on a new solution
- Data warehouse on the server
- User friendly tool for data analytics and ad hoc reporting

# Future State

# Implications for the Future

- Design data capture tools that enable efficiency and clinical flow
- Build in reminders / decision support into the standardized tools
- Vendors and OntarioMD Practice Advisors need to work with front line clinicians to balance the tension between standardization and customization of EMR data fields.

### Canadian Diabetes Association's Driving Guidelines For Driving a Private (non-commercial) Vehicle

**Hypoglycemia (low blood glucose) can affect driving. To ensure safety when driving and to avoid injury to yourself and others it is necessary to:**

1. Assess your ability to drive by keeping accurate blood glucose monitoring records.
2. Check that your blood glucose meter is measuring accurately (*see pg.2*).
3. Take an active role in getting up to date information about avoiding, recognizing and properly treating hypoglycemia (*see pg.2*).
4. You must always measure your blood glucose level immediately before driving and at least every 4 hrs during long drives. If you do not have signs or symptoms of low blood glucose (that is, you have hypoglycemic unawareness) you need to test your blood glucose every 2 hours when driving.
5. You must not drive if your blood glucose level is less than 4.0 mmol/L.
6. If your blood glucose level is less than 4.0 mmol/L treat it by taking carbohydrate as indicated on pg. 2. After successfully treating low blood glucose you must wait a minimum of 45 to 60 minutes before driving. Recheck your blood glucose after 45 to 60 minutes and do not drive until it is over 5.5 mmol/L.
7. If your blood glucose is in the 4.0 to 5.0 mmol/L range before driving you should have a snack containing carbohydrate prior to driving.
8. Always keep a source of sugar to treat hypoglycemia within easy reach when driving and always have your blood glucose monitoring equipment and supplies for treating hypoglycemia with you when driving.
9. If you feel like your glucose is low while driving or you are having problems driving, pull over safely, stop the car, measure your blood glucose and treat if

Sep 11, 2016

Dear Dr. Gregory House,

**Re:** White, Snow  
21 Dwarves Cottage Way  
Neverland, ON S1S 1S1  
Home: (123) 456-7891, Cell: (000) 000-0000  
**DOB:** Aug 08, 1988  
**HC:** 0000 000 00000  
**MRN:** 123456

Thank for referring Snow White for a diabetes consultation.

**Endocrine Diagnoses:**

PCOS  
Type 2 diabetes

**PMHX:**

Appendectomy  
Hypertension  
Acid reflux

**Active Medications**

Ramipril 5 mg Oral Capsule, JANUMET 50-1000 MG TABLET

**Known Allergies:**

No Known Drug Allergies

**Family History:**

depression (Cousin)  
bipolar disorder - stepmother  
Acne (Brother)

**Lifestyle Notes:**

Non-smoker  
Alcohol use - none  
Relationship status - waiting for her prince to come

**Glycemic Control:**

Current issues: Diabetes discovered 3 months ago in infertility clinic. A1C 8.5%

Lifestyle management: Not exercising

She is working with the SUNDEC diabetes education team.

Current diabetes pharmacologic management: Janumet 50/1000 BID

She is not doing regular blood glucose self-monitoring.

She is not experiencing any hypoglycemia.

**Complication Monitoring:**

Eye examination: Aug 2016. She has no symptoms of peripheral neuropathy. She has no chest pain. She has no shortness of breath.

**Physical examination**

Blood pressure: 111/70 Heart rate: 90 bpm Weight: 125 kg

Thyroid had normal size and texture. There was no cervical lymphadenopathy. Chest was clear. Abdominal examination was unremarkable. Peripheral pulses were palpable. Monofilament sensation was normal.

**Investigations**

A1c: 7.5 % (Sep 11, 2016) Previous: ( )

Albumin-creatinine ratio: 4.5 (Sep 11, 2016)

Creatinine: 65 umol/L eGFR: 90 (Sep 11, 2016)

Total chol: 4.5 mmol/L TG: 1.2 mmol/L LDL: 3.5 mmol/L HDL: 0.8 mmol/L (Sep 11, 2016) TSH: 2.5 Sep 11, 2016

**Impression and plan**

**Glycemic Control:** Her glycemic control target is an A1c of <7% given desire to conceive. Her glycemic control is above our target. Will need to stop januvia and start insulin. Suggest Levemir 10 units QHS. Will work with RN to titrate to target fasting <6.0 and 2hr PC <7.5

**Complication Monitoring:** Retinopathy screening is up-to-date. Nephropathy: : Mild microalbuminuria. Suggested she remain on ACE-I until conception then will have to switch to safer med for pregnancy. There is no neuropathy. There is no evidence of macrovascular disease.

**Risk Factor Modification:** Her blood pressure is below the target of 130/80. Her LDL is above the target of 2.0 mmol/L. Lipids: Will not start statin as she is planning pregnancy.

**Other recommendations:** We reviewed hypoglycemia avoidance while driving: specifically that blood sugar should be above 5 mmol/L to drive, and a fast-acting carbohydrate source and glucose meter should be kept in the car. I counselled her on the importance of achieving excellent glycemic control prior to becoming pregnant because of the risk of fetal anomalies in the first trimester and potential worsening of microvascular complications during pregnancy. We set a new self-management goal: she will work with RD and aim for a 5-10 lb weight loss before pregnancy. 30 min of moderate activity 3 times/ week . I recommend that she receive the influenza vaccine.

**Follow up:** She will return for follow-up in 6 weeks.
